

To the Commissioner of Patents and Trademarks:

Your petitioner, William F. Miller, a citizen of the United States of America, and residing at 174 Farmersville Road, So. Sandwich, MA 02563-2640, prays that Letters Patent be issued to him for the invention entitled, Air Conditioner Cover, of which the following is a specification.

Air Conditioner Cover

BACKGROUND OF THE INVENTION

This invention relates to air conditioners, and in particular to a cover for an outdoor air conditioner unit.

Split system air conditioners are widely used in which an outdoor unit houses the compressor, condenser, fan, and control components. The outdoor unit is installed near the exterior of the building in which the evaporator is located.

Split system air conditioners are usually made with an open-grill construction to eliminate moisture build-up within the unit. However, the open-grill construction exposes the unit's motor and other operative parts to debris such as leaves. Protective covers for outdoor units are known in which a shroud of flexible, weather resistant material envelops the outdoor unit to protect against the weather, moisture, dirt, leaf particles, and other debris when the unit is not in use. However, these protective covers are moisture impervious and permit humidity to develop under the cover within the unit thereby corroding the structure and operative parts of the unit.

SUMMARY OF THE INVENTION

The present invention's general purpose is to overcome the difficulties with prior art outdoor air conditioning units by providing a mesh-type air conditioner cover adapted to cover an entire outdoor unit. The mesh-type construction of the invention cover keeps a substantial amount of debris out of the air conditioner while eliminating humidity build-up.

These together with other objects of the invention, along with various features of novelty which characterize the invention, are pointed out with particularity in the claims annexed hereto and forming a part of this disclosure. For a better understanding of the invention, its operating advantages and the specific objects attained by its uses, reference should be had to the accompanying drawings and descriptive matter in which there is illustrated a preferred embodiment of the invention.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is an elevational view, partly broken away, of the exterior condenser unit of a split system air conditioner whose air inlet grill and finned coil are partially broken away to show its operative components.

Fig. 2 is a top view of the unit of Fig. 1.

Fig. 3 is an elevational view of the protective cover of the present invention, secured onto the compressor unit such as that of Fig. 1.

Fig. 4 is a top view of the cover shown in Fig. 3.

Fig. 5 is a diagrammic view of the cover shown in Figs. 3 and 4.

Fig. 6 is an elevational view of a second embodiment of the protective cover of the present invention, secured onto the compressor unit such as that of Fig. 1.

Fig. 7 is a top view of the cover shown in Fig. 6.

DETAILED DESCRIPTION OF THE INVENTION

Referring to the drawings in detail wherein like elements are indicated by like numerals, there is shown in Figs. 1 and 2 a conventional top discharge exterior condenser unit 10 of a split system air conditioner resting on a concrete base pad 15. The condenser has a top with a outlet grill 12 centrally positioned therein a nearly circumferential vertical finned heat exchanger coil 17 sheathed by a protective air inlet grill 11, conventional sealed operating components 20 substantially centered at the base of the condenser 10 within the heat exchanger coil 17, and a control unit 18 housing conventional refrigerant valves 19. The top outlet grill 12 has a horizontal outer surface 13 and a

horizontal under surface 14. A compressor fan motor 21 is centrally mounted on a central plate 16 attached to the undersurface 14 of the top outlet grill 12. A motor shaft 22 extends vertically downward from the fan motor 21 and terminates in a hub 23 bearing a plurality of horizontal fan blades 24. When the unit 10 is in operation, air flows unrestrictedly into the air inlet grill 11 and out through the open outlet grill 12.

One embodiment of the cover 30 of the present invention is shown in diagram in Fig. 5 and illustrated in Figs. 3 and 4 covering the condenser unit 10 described above. The cover 30 is comprised of a mesh top panel 31, an attachment skirt 40 and a mesh extended skirt 50. The top panel 31 is comprised of a relatively fine mesh 32, and is adapted to lay horizontally flat upon and extending to but not beyond the top outlet grill 12, thereby shielding the horizontal outer surface 13 of the outlet grill 12 from debris. Particles finer than the top panel mesh 32 will fall through the condenser unit 10 to the base pad 15. The mesh structure of the top panel 31 permits air and moisture within the condenser unit 10 to freely pass up and through the top outlet grill 12, out of the condenser unit 10, and through the cover top panel 31. The cover top panel 31 may be constructed from a durable, weather impervious material. The top panel 31 has an outer perimeter edge 33 to which is joined an attachment skirt 40 which extends perpendicularly downward from said top panel

perimeter edge 33. The top panel outer perimeter edge 33 may be fixedly joined to the attachment skirt 40 or may be removably joined such as by means of a weather resistant zipper.

The attachment skirt 40 is an elongated, flexible element having an elongated upper edge 41, an elongated lower edge 42 and two side ends 43, 44 with attachment means 45, 46 at each end. The two side ends 43, 44 define the elongated central axis of the attachment skirt 40. The attachment means 45, 46 may be comprised of hook and pile fasteners, sold under the Velcro trademark. A Velcro strip 45 may be affixed to one skirt side end 43 and a matching Velcro strip 46 attached to the other skirt side end 44, said strips adapted to engage each other in a fastener relationship. The attachment skirt 40 is adapted to snugly and radially fit about the condenser unit 10 adjacent to the top outlet grill 12. The skirt attachment means 45, 46 provide adjustment means for condenser units of varying diameters as well as shapes. The attachment skirt 40 may be constructed from a durable, weather resistant heavy grade vinyl or vinyl impregnated cloth. The attachment skirt upper edge 41 is fixedly attached to said top panel outer perimeter edge 33. The attachment skirt lower edge 42 is fixedly joined to said mesh extended skirt 50 which extends downwardly from said attachment skirt 40 about the condenser unit 10.

The mesh extended skirt 50 has a generally rectangular shape and is comprised of a relatively fine mesh 51 and is adapted to lay vertically about the condenser unit 10. The mesh extended skirt 50 has two long edges 52, 53 and two short edges 54, 55. One long edge 52 is fixedly joined to the attachment skirt lower edge 42. The opposite long edge 53 forms a cover bottom. The short edges 54, 55 may have attachment means 56, 57 along each edge. The attachment means 56, 57 may be comprised of hook and pile fasteners, sold under the Velcro trademark. A Velcro strip 56 may be affixed along one short edge 54 and a matching Velcro strip 57 attached to the other short edge 55, said strips adapted to engage each other in a fastener relationship. The mesh structure of the mesh extended skirt 50 permits air to freely pass into and through the condenser unit 10, through the top outlet grill 12, out of the condenser unit 10, and through the cover top panel 31. The mesh extended skirt attachment means 56, 57 provide adjustment means for condenser units of varying diameters as well as shapes. The mesh extended skirt 50 may be constructed from a durable, weather impervious material.

In another embodiment of the invention illustrated in Figs. 6 and 7, the top panel 31, attachment skirt 40 and extended skirt 50 of the cover 30 are comprised of a continuous, stretchable mesh weave. The attachment skirt of the first embodiment is replaced with an elasticized portion 40 about the outer perimeter edge 33 of the cover top panel 31 joining with and extending through the

extended skirt 50. The extended skirt bottom edge 53 has an opening 58 formed therein allowing condenser refrigerant piping to pass through the cover 30. The opening 58 is approximately two inches by two inches and is sealable with a hook and pile type fastener 59. In this embodiment of the invention, the mesh is made from a breathable elastomeric material. The mesh cover 30 may have various shapes such as round, rectangular, square, etc., and can be either tall, squat or cube shaped.

Applicant has found that the mesh-type cover may be made from a perforated neoprene-like material sold under the tradename, AIRPRENE, by Airprene, LLC., Beverly Hills, California. Neoprene is a synthetic rubber resistant to oil, heat, etc. Standard neoprene does not permit passage of moisture, while AIRPRENE, by virtue of a unique perforated design, which makes it a breathable elastomeric material, dissipates moisture.

It is understood that the above-described embodiment is merely illustrative of the application. Other embodiments may be readily devised by those skilled in the art which will embody the principles of the invention and fall within the spirit and scope thereof.
